

**Installation:**

Download the latest demo version from our website. Double-click the install package to begin the install. Select the continue option. You will then get a prompt with the title "Software License Agreement". Read the agreement and click "Continue". Next, click the "Agree" button. Select the hard drive to install MediaRECOVER to, by selecting a drive icon. You may also click the "choose" button to select a folder in that drive. Finally, select the Continue option. Select Install or Upgrade to add MediaRECOVER to your computer.

Quick Start Tutorial

How to use MediaRECOVER Image Recovery - Mac software:

1. After installing, open your Applications Folder and click on the MediaRECOVER icon.
2. Select the Source Drive drop down menu and choose the media from which you would like to recover files from. MediaRECOVER will only list removable media. If your camera, connected to your computer, does not show up as a removable drive you may need to use a card reader. Card readers access data from your removable media.
3. Select the Destination Folder to which MediaRECOVER should save recorded files.
4. Click Start button to begin recovery of files.
5. MediaRECOVER will then scan your source drive and place all of the recovered files into the destination folder. You can monitor the progress of the recovery in the Status Area.

* Please note that the demo version will only allow you to recover a single file, however it will allow you to preview all recoverable files.
